

AMGA Master Gardener FAQ

Home Composting: What has worked well over time?

Question:

What practical strategies have helped you successfully produce compost for garden use?

Answer:

After seven years of experimenting with home composting, I've found that a few consistent practices make a real difference:

- Keep the compost moist.
 - Compost breaks down best when it stays slightly damp. During dry periods, I add water using a bucket or hose to maintain moisture.
- Reduce the size of tough materials.
 - Hard or slow-to-decompose items, such as squash rinds, are chopped into small pieces before being added to the compost. I use a blender for these materials, which helps speed up decomposition.
- Supplement with municipal compost.
 - In my region, high-quality compost is available at the municipal compost centre. I bring my blue recycling box and hemp planter bags to collect it, then mix this compost with my home-produced compost. This combination provides both volume and consistency.

This approach has allowed me to build garden beds along my 90-foot rail fence, which I plan to plant with wildflowers grown from seed. Overall, it has been a low-cost but labour-intensive project, well suited to gardeners who prefer to invest time rather than money.

A “before” photo of the project is shown here. An updated photo will be shared once planting is complete in summer 2026.

— Gardener, Saint-Jean-sur-Richelieu

Master Gardener Tip

Successful composting depends on three key factors: moisture, air, and surface area. Keep compost about as damp as a wrung-out sponge, chop materials into smaller pieces to increase surface area, and turn the pile occasionally to introduce oxygen and speed decomposition.
